

AI-POWERED MULTI-DISEASE RISK ASSESSMENT REPORT

Generated by Clinical Intelligence Core Engine Architecture — Demo Blueprint

1. Patient Baseline Metrics & Vitals (Sample Run)

Metric	Value Submitted	Metric	Value Submitted
Age	45 years	Gender	Male
BMI	28.4 kg/m²	Blood Pressure	130/85 mmHg
Fasting Glucose	115 mg/dL	Total Cholesterol	210 mg/dL
Smoking Status	Never	Physical Activity	2.5 hrs/wk

2. Consolidated Disease Risk Matrix

Target Disease	Calculated Risk	Primary Risk Drivers (SHAP Value Shifts)
Diabetes	52.0%	Elevated Glucose (+25.0%), High BMI (+12.0%), Age > 40 (+8.0%)
Heart Disease	58.0%	Elevated Blood Pressure (+18.0%), High BMI (+12.0%), Age > 40 (+8.0%)
Liver Disease	22.0%	High BMI (+12.0%)
Kidney Failure	20.0%	High BMI (+12.0%)

3. AI-Driven Preventative Health Strategies

- **Weight Management:** Your BMI falls in an elevated range. Integrating dietary modifications and calorie deficit planning can scale down overall cardiac stress metrics.
- **Glycemic Control:** Fasting blood sugar shows pre-diabetic or elevated patterns. Restructure carbohydrate loading cycles and track postprandial glucose levels.
- **Cardio Acceleration:** Elevate metabolic output to minimum 150 minutes of zone-2 aerobic activity per week to optimize arterial elasticity and lower multi-disease indices.
